Vega Configuring Guide

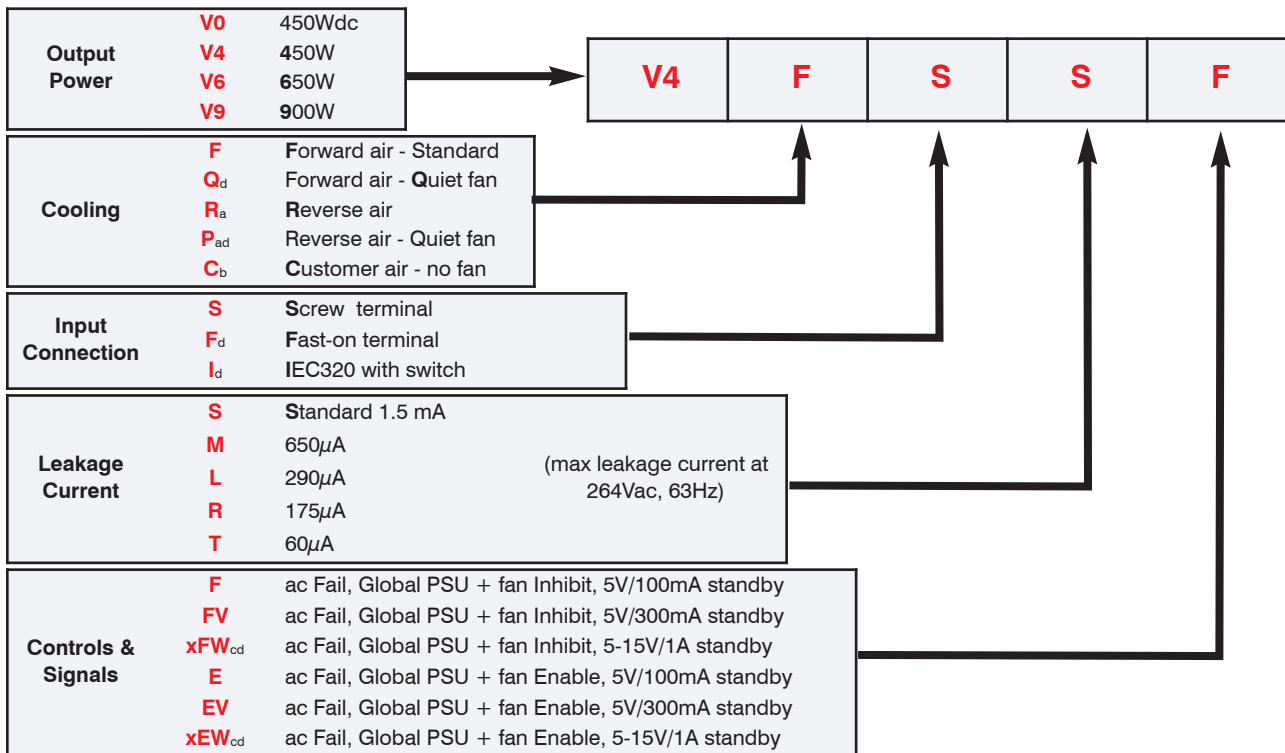

The extensive range of output modules and options make it possible to achieve almost any combination of Volts and Amps. The 'online' configurator is the best way to achieve the optimum configuration, however you can also create your own Vega configuration from this datasheet by using the guide below.

Web Configurator

- 1 Visit <http://www.emea.tdk-lambda.com>, select 'Vega Configurator' and follow the online instructions.
- 2 Enter your required Volts / Amps, type of output connection and any additional functions (if required)
- 3 Enter preferred type of cooling, input connection, lower leakage current (if required) and controls & signal functions, (if required)
- 4 Configurator will select the most suitable modules and options and give a unique part number.

Configuring from Datasheet

- 1 Calculate total output power to determine Vega 450W, 650W or 900W and select converter, then select required Cooling, Connection, Leakage Current and Controls/Signals from the following table:-

Notes:

- a) Not available for Vega 900
- b) Thermocoupled sample recommended to ensure adequate cooling - consult sales
- c) xFW and xEW options increase leakage current by 90µA  
Replace 'x' with required output voltage (5FW = 5V aux supply)
- d) Not available for Vega dc.

2 Select Output Modules and Options from the Output Voltages tables.

Example - if you require 5.2V / 18A with output inhibit :-

- a) select B1H as closest match for voltage and current and prefix with voltage (eg **5.2B1H**)
- b) add suffix S or F for Screw or Fast-on connection (eg **5.2B1HS**)
- c) add suffix N for output inhibit eg **5.2B1HSN**
- d) repeat for other outputs

Ensure you do not select more than a total of 5 slots width of module. This will create a complete product description eg:-

**V6FSSF 5L1SN 12/12H3/3S 24C5S** which represents a four output 650W Vega with Forward air, Screw input terminals, 1.5mA Earth Leakage, ac Fail, Global Inhibit & 5V / 100mA aux supply with the following outputs:-

- Output 1 = 5V / 35A with output inhibit, Module Good and Current Share option
- Output 2 = 12V / 10A
- Output 3 = 12V / 6A
- Output 4 = 24V / 10A

3 Contact TDK-Lambda to validate configuration and issue a part number.
